

Gerrymandering

by Jocelyn Adams

You're responsible for redistricting a few very small states. On the following maps, voters who support your party are marked with and voters who support the opposing party are marked with . These states are only big enough for two districts, and they must contain an equal number of voters. Unfortunately, your party has a minority of voters in each state, so you'll have to be careful about where you draw the boundary. For each state, use one straight line to divide the state such that you hold the majority in one of its districts. When you're done, you'll see what we think of this practice.
